20. ABSTRACT (Continue on reverse side if necessary and identify by block number) This report provides a comparative evaluation of several leading state-of- the-art models for dam-breach flood forecasting. Nine alternative models were applied using data sets from four case studies. Results obtained were compared between models and with available measured data. Model accuracy, versatility, and ease-of-use were evaluated, and complexities and weaknesses were identified. The sensitivity of model results to various input data parameters was also investigated. The quantitative results documented by the report provide an (Continued)

PREFACE

The work reported herein was conducted under Department of the Army Project No. 4A762719AT40, "Mobility and Weapon Effects Technology," Task Area B0, "AirLand Battlefield Environment," Mission Area, "Combat Support," Work Unit 052, "Induced Floods as Linear/Area Obstacles," under the auspices of the Battlefield Terrain Working Group of the AirLand Battlefield Environment Thrust. The study was sponsored by the Office, Chief of Engineers (OCE). Dr. Clemens A. Meyer was the OCE Technical Monitor.

The study was conducted by the US Army Engineer Waterways Experiment Station (WES) under the general supervision of Dr. John Harrison, Chief of the Environmental Laboratory, and Dr. Lewis E. Link, Chief of the Environmental Systems Division, and under the direct supervision of Mr. M. P. Keown, Chief of the Environmental Constraints Group (ECG), and Mr. J. G. Collins, ECG. Mr. M. R. Jourdan, ECG. Principal Investigator, Work Unit 052, provided technical assistance and review. This report was prepared by Dr. Ralph A. Wurbs, who is an Assistant Professor at Texas A&M University working under an Inter-governmental Personnel Act agreement as a Research Engineer, ECG.

COL Allen F. Grum, USA, was the previous Director of WES. COL Dwayne G. Lee, CE, is the present Commander and Director. Dr. Robert W. Whalin is Technical Director.

## INTRODUCTION

### Hypothetical Prismatic Channel

Computational difficulties associated with the complex valley geometry was the dominant consideration in the Teton case study. Irregular valley geometry was also an important complicating factor in the Laurel Run case study. The hypothetical prismatic channel case study was developed to test the model under conditions for which irregular valley geometry was not a major concern. The reservoir data for the Teton Reservoir was combined with a prismatic channel. The prismatic channel is essentially an extension of the 5-mile long Teton canyon to 50 miles.

The prismatic channel, as shown in Figure 1, consists of two reaches of constant cross-section joined by a transition reach. The channel cross-section from mile 0 to mile 5 is constant, and the reach between miles 10 and 50 has a slightly wider constant cross-section. Miles 5 to 10 provide the transition between the two sections. The cross-section for miles 0 to 5 approximates the geometry of the narrow, steep-walled Teton canyon just below the dam. However, the remaining 45 miles of slightly wider prismatic channel does not approximate the wide, flat, abruptly changing topography of the valley of the Teton and Snake Rivers below the Teton canyon. The prismatic channel has a constant bottom slope of ten feet per mile and a constant Manning roughness coefficient of 0.040 which are representative of the canyon of the Teton River.

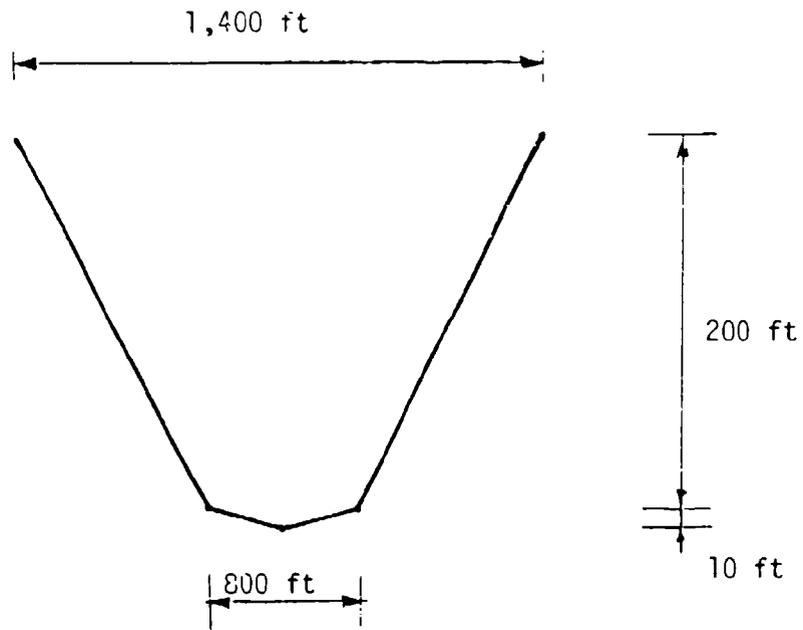

### Overview of Analysis

DAMBRK, FLOW SIM 1, FLOW SIM 2, HEC-1, SMPDBK, TR66, and the HEC dimensionless graph procedure were tested using the hypothetical prismatic channel. For purposes of comparing models, an initial "base run" set of

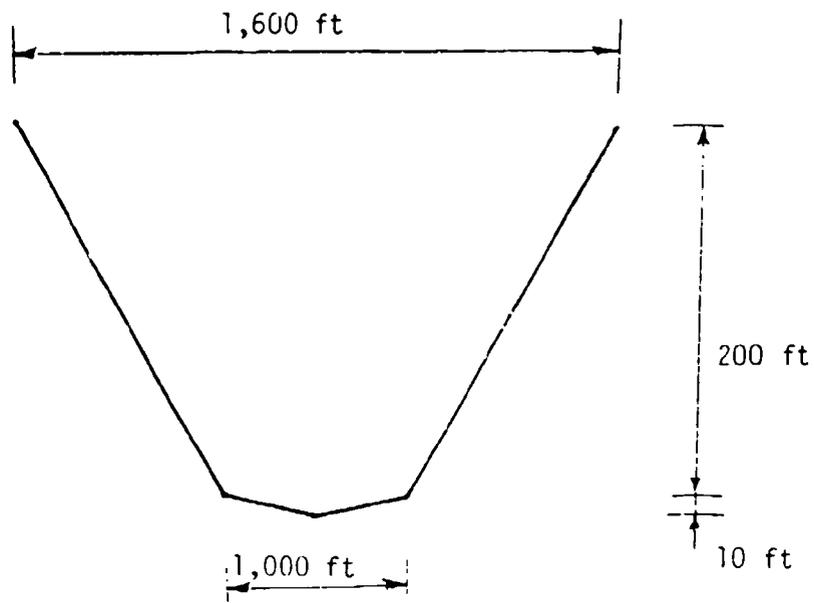

breach parameters was defined as follows: time to maximum breach size of 1.0 hour, breach width of 500 feet; and vertical side slopes. However, the HEC dimensionless graph procedure is based on an instantaneous complete removal of the dam, and TR66 uses a reservoir water depth versus maximum breach discharge relationship based on data from actual past dam failures. The other models have breach simulation routines which can reflect the above listed breach parameters. However, a solution could not be obtained for these parameter values with FLOW SIM 1 and 2 due to instabilities in the computations.

Computational instability was a major problem in applying FLOW SIM 1 and 2 and became the primary focus of the analysis with these models. Obtaining solutions was not a problem with DAMBRK. The DAMBRK analysis was used to test the sensitivity of the flow wave to variations in breach size and manning roughness coefficient. The HEC-1 analysis included testing the sensitivity of model results to the parameters NMIN and NSTPS. The TR66 procedure was applied alternatively with the peak discharge at the dam computed with the TR66 method and DAMBRK, with valley routing by the TR66 procedure in both cases. SMPDBK and the dimensionless graph procedure were applied without particular difficulties being encountered or sensitivity studies being made.

## DAMBRK RESULTS

The results of the DAMBRK analysis are summarized in Tables 1 through 4 and Figures 2 through 4. DAMBRK was used to test the sensitivity of the dam breach flood wave characteristics to breach width and Manning roughness coefficient. A constant manning  $n$  is assumed all along the channel. The results of four runs are presented in the tables and figures with alternative  $n$  values of 0.04, 0.06, 0.08, and 0.12 and all other input data constant. Likewise, alternative runs are presented with alternative final breach widths of 100 feet, 300 feet, 500 feet, and 700 feet and all other input data constant. Appendix A is a listing of the DAMBRK base run (breach width of 500 feet and  $n$  values of 0.40).

Several unsuccessful trial runs were required to debug the input data and establish workable distance steps. After these initial runs to get the model running, computational problems, such as nonconvergence and instability, were not encountered.

## FLOW SIM 1 RESULTS

Computational instability was a major problem in applying FLOW SIM 1 to the prismatic case study. A solution could not be obtained with the original set of parameter values which included a 500-foot breach width, 1.0 hour breach time, and constant 0.04 Manning n. Numerous runs were made in an effort to obtain a solution with input data as close to these parameter values as possible. Alternative runs included various combinations of values for the following input parameters: spatial step size (DELX), maximum hydraulic depth (HMAX) which is used by the program to determine the time step, Manning roughness coefficients (n), breach time, and breach width. A few runs were successful. Most runs terminated without obtaining a solution. The output from the unsuccessful runs usually included a message that the program terminated because of an instability in the calculations.

Spatial step sizes of 1.0 mile, 0.5 mile, 0.2 mile, and 0.13 mile resulted in the same difficulties with computational instability. HMAX was varied from 40 feet to 400 feet with most runs using a value of 80 or 100 feet. The effects of DELX and HMAX on stability were never clearly established. A DELX of 5,280 feet and HMAX of 80 feet seemed to perform as well as, and in some cases better than, other values of these parameters.

Table 5 illustrates how obtaining a solution depends upon breach characteristics and n values. Several runs with alternative combinations of breach width, breach time, and constant Manning n are tabulated along with an indication of whether a solution was obtained or the run terminated due to instability. Input data other than the three parameters indicated were held constant for all the runs in the table. Values for DELX and HMAX of 5,280 feet and 80 feet were used.

A run with the same breach characteristics used in the Teton case study

(one-hour breach time, bottom width of 50 feet, and 0.66 sideslopes) and Manning n values of 0.040 also terminated without reaching a solution.

The prismatic channel is representative of a steep-walled canyon. The cross-section side-slopes change abruptly from the canyon floor to the walls. An alternative run was made with the topwidths at the top of the canyon three times wider than the cross sections used in all the runs discussed above. This meant a much less drastic change in sideslope between the canyon floor and walls. With a breach width of 500 feet, breach time of 1 hour, and n-values of 0.04, DELX of 5,280 feet, and HMAX of 80 feet, the program still terminated due to an instability in the calculations. However, the stability characteristics of this widened prismatic channel were not investigated further.

Table 6 summarizes the FLOW SIM 1 results for a breach width of 100 feet, breach time of 1.0 hour, and Manning n values of 0.06. The computer printout for this run is provided in Appendix B. The results of a DAMBRK run with these same parameters are presented in Table 7 for purposes of comparison. Figures 5 through 7 also provide a comparison of the FLOW SIM 1 and DAMBRK results for a breach width of 100 feet, breach time of 1.0 hour, and n values of 0.06.

Appendix C provides a computer printout for one of the unsuccessful FLOW SIM i runs. This run used a DELX of 1056 feet, HMAX of 80 feet, breach width of 300 feet, breach time of 1.0 hour, and Manning n values of 0.060. The output includes a message that execution of the program was terminated because of an instability in the calculations. The output from the other unsuccessful runs is similar to the Appendix C printout.

## FLOW SIM 2 RESULTS

FLOW SIM 2 was also run with numerous combinations of values for the input parameters. Almost all runs terminated without obtaining a solution. The output from the unsuccessful runs usually included a message that the program terminated because of an instability in the calculations. Essentially the same ranges of values for DELX, HMAX, breach time, breach width, and Manning roughness coefficient investigated with FLOW SIM 1 were repeated with FLOW SIM 2. However, most of the combinations of input parameter values which ran successfully in FLOW SIM 1 terminated without solutions in FLOW SIM 2. The only successful runs of FLOW SIM 2 had a breach time of 5 hours.

The printout for an unsuccessful FLOW SIM 2 run is provided in Appendix D. The input data for this run includes a DELX of 1056 feet, HMAX of 80 feet, breach width of 100 feet, breach time of two hours, and Manning n values of 0.06. The output from the other unsuccessful runs is similar to the Appendix D printout.

## HEC-1 RESULTS

Tables 8 and 9 and Figures 8 through 10 summarize the results of several HEC-1 runs with alternative sets of values for the parameters NSTPS and NMIN. The computational interval (NMIN) is not a critical parameter as long as it is small enough. Selection of a NMIN value is essentially a tradeoff between accuracy and computation costs. Since HEC-1 computer costs are modest, setting NMIN is not a problem. The number of steps (NSTPS) to be used in the storage routing is a somewhat arbitrarily determined parameter which can significantly affect the computed hydrograph. The HEC-1 users manual states that NSTPS is usually approximated by the following relationship.

$$\text{NSTPS} = (\text{reach length}/\text{average velocity})/\text{time interval}$$

Computer runs are labeled by number in the following tables and figures. A value for NMIN of 4 minutes was used in runs 1 through 4 and 10 minutes in runs 5 through 7. NSTPS values used for each of 5 reaches were alternatively assumed to be a constant 1, 5, and 10 for each reach. Runs were also made in which the NSTPS values were estimated from the above relationship. For NMIN of 4 minutes, this resulted in NSTPS values of 4, 5, 7, 8, and 13 for the five reaches (run 4). For NMIN of 10 minutes, NSTPS values were estimated to be 2, 2, 3, 3, and 5 (run 7). The five reaches are: miles 0 to 7.5, miles 7.5 to 15, miles 15 to 25, miles 25 to 35, and miles 35 to 50.

The results for NMIN values of 4 minutes and 10 minutes are very close. However, changing the NSTPS parameters significantly changes the resulting discharges and stages. Run 4 (NMIN = 4 minute and NSTPS values of 4, 5, 7, 8, 13 for the five reaches) is probably the most realistic run. The computer printout for run 4 is provided in Appendix E.

## HEC DIMENSIONLESS GRAPHS PROCEDURE RESULTS

The HEC dimensionless graph procedure is based on the assumption of an instantaneous complete removal of the dam. Thus, the breach characteristics (500 feet width and 1.0 hour breach time) used in the other models could not be incorporated in the dimensionless graph procedure. The prismatic channel characteristics are the same as used in the other models. The required computations for the procedure are presented in Table 12 and the results are summarized in Table 11.

Table 11

## TR66 RESULTS

The SCS Technical Release No. 66 simplified dam breach routing procedure results are presented in Table 13 and Figures 16 and 17. The calculations are summarized in Table 14. This manual computation procedure provides peak discharges and depths at selected locations. The peak discharge at the dam is determined from a relationship between peak discharge and reservoir water depth which was developed based on data from actual past dam failures. The peak discharge of 1,931,000 cfs computed with the TR66 procedure is about half the magnitude of the peak outflow from the 500-foot wide breach computed by the other models. Consequently, an additional simulation was made in which the 3,841,000 cfs peak discharge at the dam computed with the DAMBRK model was routed downstream with the TR66 valley routing procedure. The results using TR66 for both breach outflow and valley routing are labeled TR66 in the tables and figures. The label TR66 (DAMBRK) is used to signify that the DAMBRK peak breach outflow is combined with TR66 valley routing.

## COMPARISON OF MODEL RESULTS

A comparison of the results obtained using DAMBRK, HEC-1, SMPDBK, TR66, and the HEC dimensionless graphs procedure are presented in Tables 15 through 18 and Figures 18 through 20. Both HEC-1 runs 1 and 4 are shown. HEC-1 run 1 used a NSTPS value of 1 for all reaches, whereas run 4 used NSTPS values of 4, 5, 7, 8, and 13 for the five reaches. The HEC dimensionless graph procedure assumes an instantaneous complete removal of the dam. The other models reflect a breach width of 500 feet and breach time of 1.0 hour. Solutions could not be obtained with these breach parameters using FLOW SIM 1 and FLOW SIM 2. Runs with these two models terminated with a message that an instability in the calculations had occurred.

DAMBRK Base Run

PROGRAM DAMBRK . . . VERSION: A-01/30/82

ANALYSIS OF THE DOWNSTREAM FLOOD HYDROGRAPH  
PRODUCED BY THE DAM BREAK OF

SIMPLIFIED TETON

ON

ALMOST PRISMATIC

ANALYSIS BY

SIMPLIFIED TEST CASE  
RALPH WURBS  
OCTOBER 1983

BASED ON PROCEDURE DEVELOPED BY

DANNY L. FREAD, PH. D., RESEARCH HYDROLOGIST  
HYDROLOGIC RESEARCH LABORATORY  
W23, OFFICE OF HYDROLOGY  
NDA4, NATIONAL WEATHER SERVICE  
SILVER SPRING, MARYLAND 20910

SIMPLIFIED TETON RESERVOIR AND BREACH PARAMETERS

PARAMETER	UNITS	VARIABLE	VALUE
LENGTH OF RESERVOIR	MI	RLM	15.00
ELEVATION OF WATER SURFACE	FT	Y0	5301.70
SIDE SLOPE OF BREACH	Z		0.0
ELEVATION OF BOTTOM OF BREACH	FT	YBMIN	5040.00
WIDTH OF BASE OF BREACH	FT	BB	500.00
TIME TO MAXIMUM BREACH SIZE	HR	TFM	1.00
ELEVATION (MSL) OF BOTTOM OF DAM	FT	DATUM	5030.00
VOLUME - SURFACE AREA PARAMETER	VOL		1.00
ELEVATION OF WATER WHEN BREACHED	FT	HF	5301.70
ELEVATION OF TOP OF DAM	FT	HD	5330.00
ELEVATION OF UNCONTROLLED SPILLWAY CREST	FT	HSP	0.0
ELEVATION OF CENTER OF GATE OPENINGS	FT	HGT	0.0
DISCHARGE COEF FOR UNCONTROLLED SPILLWAY	CS		0.0
DISCHARGE COEF FOR GATE FLOW	CG		0.0
DISCHARGE COEF FOR UNCONTROLLED WEIR FLOW	CDD		0.0
DISCHARGE THRU TURBINES	CFS	QT	30000.00

CDD SHOULD NOT BE 0.00 IF OVERTOPPING MAY OCCUR

DHF (INTERVAL BETWEEN INPUT HYDROGRAPH ORDINATES) = 0.0 HRS  
 TET (TIME AT WHICH COMPUTATIONS TERMINATE) = 60.0000 HRS

INFLOW HYDROGRAPH TO SIMPLIFIED TETON

3580.00 3580.00

TIME OF INFLOW HYDROGRAPH ORDINATES

0.0 60.0000

CROSS-SECTIONAL PARAMETERS FOR ALMOST PRISMATIC  
BELOW SIMPLIFIED TETON

PARAMETER	VARIABLE	VALUE
NUMBER OF CROSS-SECTIONS	NS	5
MAXIMUM NUMBER OF TOP WIDTHS	NCS	3
NUMBER OF CROSS-SECTIONAL HYDROGRAPHS TO PLOT	NTT	0
TYPE OF OUTPUT OTHER THAN HYDROGRAPH PLOTS	JMK	1
CROSS SECTIONAL SMOOTHING PARAMETER	KSA	0
DOWNSTREAM SUPERCRITICAL OR NOT	KSUPC	0
NO OF LATERAL INFLOW HYDROGRAPHS	LQ	0
NO OF POINTS IN GATE CONTROL CURVE	KCS	0

CROSS-SECTIONAL VARIABLES FOR ALMOST PRISMATIC  
BELOW SIMPLIFIED TETON

PARAMETER	UNITS	VARIABLE
LOCATION OF CROSS-SECTION ELEVATION (MSL) OF FLOODING AT CROSS-SECTION	MI	XS(I) FSTG(I)
ELEV CORRESPONDING TO EACH TOP WIDTH (ACTIVE FLOW PORTION)	FT	HS(K,I) BS(K,I)
TOP WIDTH CORRESPONDING TO EACH ELEV (OFF-CHANNEL PORTION)	FT	BSS(K,I)

PARAMETER AND CONTROL CONSTANTS

PARAMETERS/CONSTANTS	UNITS	NOTATION	VALUE
SPATIAL STEP	FT	DELX	1056.00
MAXIMUM HYDRAULIC DEPTH	FT	HMAX	80.00
MANNINGS N-VALUE (CONSTANT)		CCCN	0.000
SPATIAL DIMENSIONS		DIMEN	5280.00
SIMULATION TIME	HRS	TTIME	50.00
PRINT TIME INTERVAL	HRS	PTIME	0.25
TIME INTERVAL FOR BOUNDARY VALUES	HRS	RTIME	60.00
DOWNSTREAM BOUNDARY CONTROL COEFFICIENT		CBOUND	0.00
RUN TIME CONTROL	HRS	TSUP	0.00
FACTOR FOR GROUND WATER FLOW		OFACT	0.000
NUMBER OF STREAMS		NJ	1
NUMBER OF BARRIERS OR DAMS		KB	1
NUMBER OF EXPANSIONS		KE	0
NUMBER OF CONSTRICTIONS		KC	0
NUMBER OF LATERAL OUTFLOW LOCATIONS		LOM	0
OPTION FOR PRINTING CHANNEL DATA		IABC	0
PRINTOUT CONTROL		ISUP	0
LATERAL INFLOW INFUT OPTION		ITAPE	0
TAILWATER OPTION		ISUB	1
NUMBER OF LATERAL INFLOW LOCATIONS		LIM	0
TOTAL NUMBER OF Z OR Q NODES	MM	MM	251
NUMBER OF RAW DATA STATIONS		ISTAM	6

CONTROL FOR DOWNSTREAM WATER LEVEL            ITT            0  
 OVERRANK STORAGE CONTROL                    1STOR           0  
 NUMBER OF RAW DATA IN VERTICAL FOR X-SEC    KDATA           3  
 CONTROL FOR RESERVOIR REGULATION            NREG            0  
 NUMBER OF RESERVOIR ELEVATIONS              KRES            0  
 NUMBER OF RESERVOIR STORAGE VALUES        IDATA           8  
 HYDROGRAPH PRINTING OPTION                  IHYD            0  
 FLOODED OR DRY BED INDICATOR                ITRY            0  
 NUMBER OF PLOTTING LOCATIONS                IPLOT           0  
 NUMBER OF DIVIDED FLOW CHANNELS            MCDN            0  
 OPTION FOR PRINTING LAST Z AND Q VALUES    LAST            0  
 RATIO OPTION FOR UPSTREAM INFLOW VALUES    INFAC           0

TIME STEP (DELTA) = 20 00 SEC

MAXIMUM I VALUE FOR EACH STREAM

251

TYPE OF BREACH OPTION

0

RESERVOIR, DAM AND BREACH PARAMETERS

SPILLWAY PARAMETERS - DAM NUMBER 1  
 SPILLWAY CREST ELEVATION ..... 5301.70 FEET  
 DISCHARGE COEFFICIENT ..... 0 00  
 SPILLWAY CREST WIDTH ..... 0 00 FEET

RESERVOIR INITIAL CONDITIONS - DAM NUMBER 1  
 RESERVOIR STORAGE ..... 252.200 (K AC-FT)  
 RESERVOIR INFLOW ..... 3850 00 CFS  
 RESERVOIR OUTFLOW ..... 30000 00 CFS

ELEVATION VS STORAGE - DAM NO. 1

RES. EL (FEET)	STORAGE (K AC.-FT)

UPSTREAM BOUNDARY DISCHARGE IN CFS

3580 00 3580 00

CAUTION --- WATER LEVEL EXCEEDED SPECIFIED CHANNEL DEPTH. BANK ELEVATIONS WERE INCREASED IN VERTICAL TO OBTAIN SUFFICIENT CROSS SECTIONAL AREA FOR THE CALCULATIONS.

NOTE ---- EXECUTION OF THE PROGRAM IS TERMINATED BECAUSE OF AN INSTABILITY IN THE CALCULATIONS INPUT DATA SHOULD BE CHECKED FOR POSSIBLE ERRORS AND IF NONE ARE FOUND IT MAY BE NECESSARY TO INCREASE EITHER NMAX OR THE MANNINGS N-VALUES.

PARAMETER AND CONTROL CONSTANTS

PARAMETERS/CONSTANTS	UNITS	NOTATION	VALUE
SPATIAL STEP	FT	DELY	1056.00
MAXIMUM HYDRAULIC DEPTH	FT	HMAX	80.00
MANNINGS N-VALUE (CONSTANT)		CCON	0.0000
SPATIAL DIMENSIONS		DIMEN	5280.00
SIMULATION TIME	HRS	TTIME	60.00
PRINT TIME INTERVAL	HRS	P TIME	0.25
TIME INTERVAL FOR BOUNDARY VALUES	HRS	R TIME	60.00
DOWNSTREAM BOUNDARY CONTROL COEFFICIENT		CBOND	0.00
RUN TIME CONTROL	HRS	TSUP	0.00
NUMBER OF STREAMS		NJ	1
NUMBER OF BARRIERS OR DAMS		KB	1
NUMBER OF EXPANSIONS		KE	0
NUMBER OF CONSTRUCTIONS		KC	0
NUMBER OF LATERAL OUTFLOW LOCATIONS		LOM	0
OPTION FOR PRINTING CHANNEL DATA		IARC	0
PRINTOUT CONTROL		PSUP	C
LATERAL INFLOW INPUT OPTION		ITAPE	0
RAILWATER OPTION		ISUB	1
TIME FOR INCREASING TIME STEP		TCH	0.00
NUMBER OF LATERAL INFLOW LOCATIONS		LIM	0
TOTAL NUMBER OF Z OR O NODES		MM	251
NUMBER OF RAW DATA STATIONS		ISTAM	6

```

CONTROL FOR DOWNSTREAM WATER LEVEL          0
OVERBANK STORAGE CONTROL                   0
NUMBER OF RAW DATA IN VERTICAL FOR X-SEC   3
CONTROL FOR RESERVOIR REGULATION           0
NUMBER OF RESERVOIR ELEVATIONS             0
NUMBER OF RESERVOIR STORAGE VALUES        8
HYDROGRAPH PRINTING OPTION                 0
FLOODED OR DRY BED INDICATOR               0
NUMBER OF PLOTTING LOCATIONS               0
NUMBER OF DIVIDED FLOW CHANNELS            0
OPTION FOR PRINTING LAST Z AND Q VALUES   0
X 10 OPTION FOR UPSTREAM INFLOW VALUES     0

```

TIME STEP (DELTA) = 20.00 SEC

MAXIMUM I VALUE FOR EACH STREAM

251

TYPE OF BREACH OPTION

0

RESERVOIR, DAM AND BREACH PARAMETERS

```

SPILLWAY PARAMETERS - DAM NUMBER 1
SPILLWAY CREST ELEVATION ..... 5301.70 FEET
DISCHARGE COEFFICIENT ..... 0.00
SPILLWAY CREST WIDTH ..... 0.00 FEET

RESERVOIR INITIAL CONDITIONS - DAM NUMBER 1
RESERVOIR STORAGE ..... 252.200 (K AC-FT)
RESERVOIR INFLOW ..... 3850.00 CFS
RESERVOIR OUTFLOW ..... 30000.00 CFS

```

ELEVATION VS STORAGE - DAM NO 1

RES. FL. (FEET)	STORAGE (K AC-FT)
5000 0	0 0000
5075 0	0 7500
5150 0	17 5000
5225 0	51 0000
5300 0	102 0000
5375 0	167 0000
5450 0	249 0000
5525 0	386 0000

DAM AND BREACH PARAMETERS - DAM NO 1

DAM OR BARRIER LOCATION \*\*\*\* 250 (M-VALUE)  
 DAM OR BARRIER ELEVATION \*\*\* 5302 FEET  
 CRITICAL BREACH ELEVATION \*\* 5302 FEET  
 TOTAL BREACH TIME \*\*\*\*\* 7200 SEC  
 BREACH SECTION SLOPE \*\*\*\*\* 0 0000  
 WIDTH OF BOTTOM BREACH \*\*\*\*\* 100 0 FEET  
 WIDTH OF DAM \*\*\*\*\* 0 FEET  
 MINIMUM BREACH ELEVATION \*\*\* 5040 FEET

THIS PROGRAM REPLACES ALL PREVIOUS VERSIONS OF HEC-1 KNOWN AS HEC1 (JAN 73), HEC1G5, HEC1DB, AND HEC1KW  
 THE DEFINITIONS OF VARIABLES -RTIMP- AND -RTIOR- HAVE CHANGED FROM THOSE USED WITH THE 1973-STYLE INPUT STRUCTURE.  
 THE DEFINITION OF -AMSKK- ON RM-CARD WAS CHANGED WITH REVISIONS DATED 28 SEP 81. SEE SEPTEMBER 1981 INPUT  
 DESCRIPTION FOR NEW DEFINITIONS.

PEAK OUTFLOW IS 3911197 AT TIME 1 00 HOURS

THE DAM BREACH HYDROGRAPH WAS DEVELOPED USING A TIME INTERVAL OF 0.022 HOURS DURING BREACH FORMATION  
 DOWNSTREAM CALCULATIONS WILL USE A TIME INTERVAL OF 0.067 HOURS  
 THIS TABLE COMPARES THE HYDROGRAPH FOR DOWNSTREAM CALCULATIONS WITH THE COMPUTED BREACH HYDROGRAPH  
 INTERMEDIATE FLOWS ARE INTERPOLATED FROM END-OF-PERIOD VALUES

TIME (HOURS)	TIME FROM BEGINNING OF BREACH (HOURS)	INTERPOLATED BREACH HYDROGRAPH (CFS)	COMPUTED BREACH HYDROGRAPH (CFS)	* ERROR (CFS)	ACCUMULATED ERROR (CFS)	ACCUMULATED ERROR (AC-FT)

CHANNEL DESCRIPTION

$$m = \frac{\sum((\log h_i)(\log B_i)) - \frac{(\sum \log h_i)(\sum \log B_i)}{I}}{\sum (\log h_i)^2 - \frac{(\sum \log h_i)^2}{I}}$$

$$\log k = \frac{\sum \log B_i}{I} - m \frac{\sum \log h_i}{I}$$

For Miles 0 to 5

$$m = \frac{10.209 - \frac{(3.322)(6.049)}{2}}{6.393 - \frac{(3.322)^2}{2}} = 0.18467$$

$$\log k = \frac{6.049}{2} - 0.18466 \frac{3.322}{2} = 2.7177$$

$$k = 522$$

$$B = kh^m = 522 h^{0.1847}$$

For Miles 10 to 50

$$B = 675 h^{0.1577}$$

MAXIMUM BREACH OUTFLOW ( $Q_{bmax}$ )

$$C = \frac{23.4 As}{B_r} = \frac{23.4 (1940)}{500} = 90.792$$

$$Q_{bmax} = Q_o = 3.1 Br \left[ \frac{C}{\tau_f + \frac{C}{\sqrt{H}}} \right]^3$$

$$= 3,590 + 3.1(500) \left[ \frac{90.792}{1.0 + \frac{90.792}{\sqrt{261.7}}} \right]^3 = 4,016,000 \text{ cfs}$$

$$a = \frac{1.49}{n} S^{0.05} \frac{k}{(m+1)^{5/3}} = \frac{1.49}{0.04} \left[ \frac{10}{5280} \right]^{0.5} \left[ \frac{522}{(.1847+1)^{5/3}} \right] = 638.2$$

$$b = m + 5/3 = 0.1847 + 5/3 = 1.851$$

$$h_{max} = \left[ \frac{Q_{bmax}}{a} \right]^{1/b} = \left[ \frac{4,016,000}{638.2} \right]^{1/1.851} = 112.7 \text{ ft}$$

Check for Submergence

$$h_{weir} = \left[ \frac{C}{\tau_f + \frac{C}{\sqrt{H}}} \right]^2 = \left[ \frac{90.792}{1.0 + \frac{90.792}{\sqrt{261.7}}} \right]^2 = 188.5$$

$$\frac{h_{max}}{h_{weir}} = \frac{112.7}{188.5} = .59 < 0.67$$

Submergence correction not required.
